

DMPR

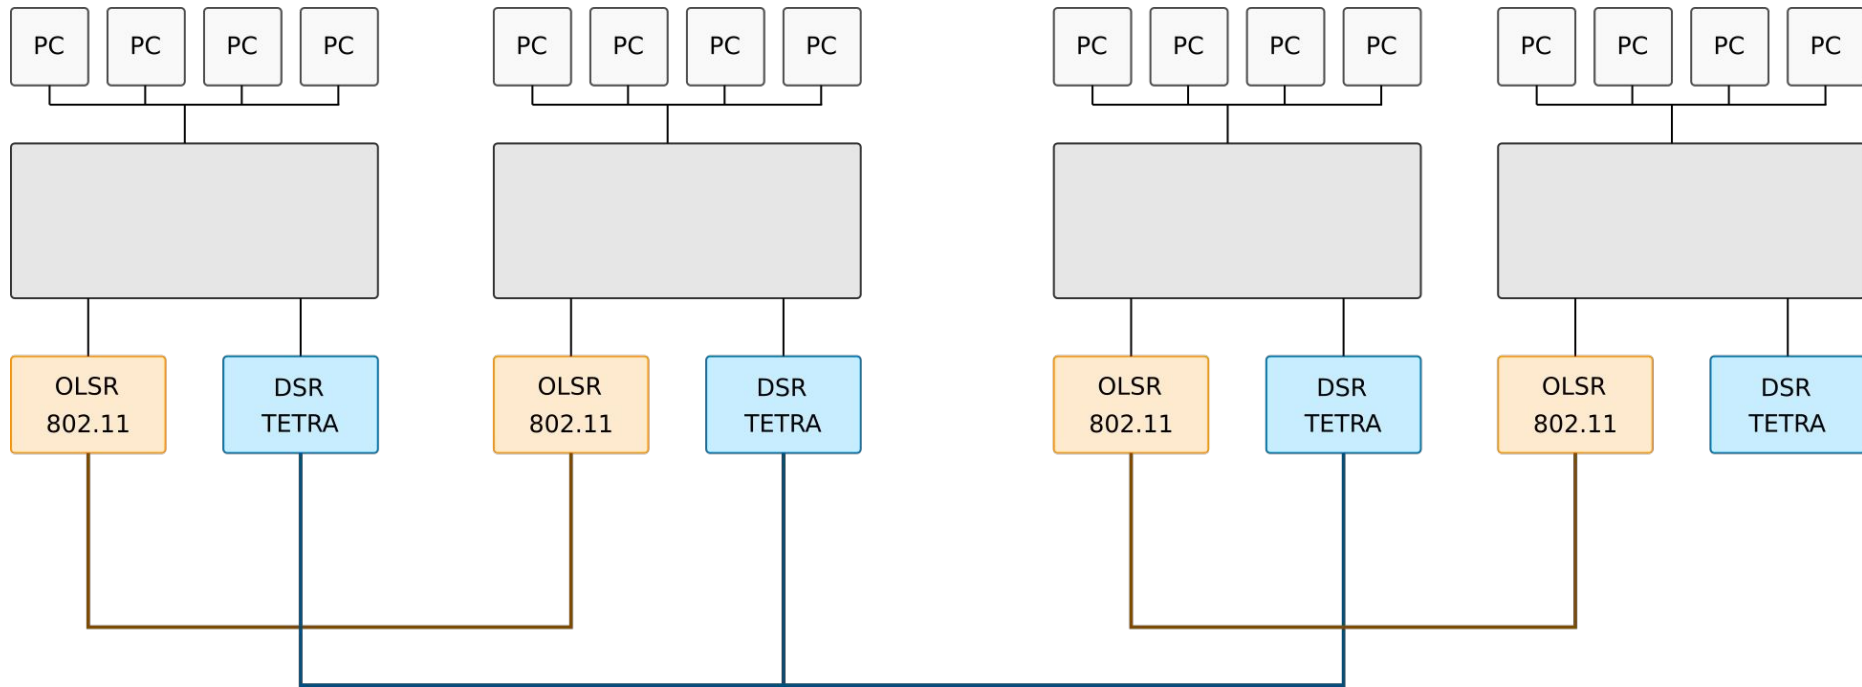

Dynamic MultiPath Routing

Hagen Paul Pfeifer
hagen@jauu.net

DMPR Introduction

Problem Statement - I

DMPR Introduction

Problem Statement - II

DMPR

Requirements

- Routing protocol gap different interior routing protocol
- Designed for highly dynamic environments (platform change)
- Suitable for low bandwidth environments (1kbyte/s) and scalable for gigabit links
- Policy based routing as a first class citizen
- Support for highly asymmetric links
- Support for unicast only transports (LTE, BGAN terminals)
- Minimal configuration effort & autonomous neighbor detection

DMPR

Offspring

Dynamic Multi Path Routing Protocol - *a loop free path vector routing protocol*

A new routing protocol based on BGP, OLSR and Babel concepts - enriched with glue logic and missing pieces

DMPR

Message Example

Routing instance A broadcast periodically messages at all interfaces

Receiving routing instances B stores received information and stores information about the received link (path characteristics)

Step 3: routing instance A broadcast a new routing message including own information and path vectors to neighbors based on the best path for enabled metrics at each interface including path characteristics

Encoding path information from C to A

lowest-loss: { C → [1] → B → [1] → A }

highest-bandwidth: { C → [2] → A }

DMPR

Path Selection Algorithm

Simple - Bandwidth (minimum function)

Simple - Loss (additive function)

Compound - Bandwidth and Loss
metric = ((K1*BW)+ (K2*LOSStotal))

Compound with Filter

DMPR

Message Format

```
low-loss:
{
  A :
  {
    network : {ipv4-prefix=10.200.1.0/24}
    next-hop : B
    sequence-no : 1
    paths : C->[1]->B->[1]->A
  }
  B :
  {
    network : {ipv4-prefix=10.100.1.0/24}
    next-hop : B
    sequence-no : 1
    paths : C->[1]->B
  }
}
high-bandwidth:
{
  A :
  {
    network : {ipv4-prefix=10.200.1.0/24}
    next-hop : B
    sequence-no : 1
    paths : C->[2]->B->[2]->A
  }
  B :
  {
    network : {ipv4-prefix=10.100.1.0/24}
    next-hop : B
    sequence-no : 1
    paths : C->[2]->B
  }
}
link-characteristics :
{
  1: { loss : 1%, bandwidth : 1Mbps, cost : 0 }
  2: { loss : 10%, bandwidth : 10Mbps, cost : 1 }
}
```
